

C1

--It will be appreciated that the array of visual display units 118 may be replaced by a simple visual display unit displaying an image comprising a plurality of regions, each region containing an image otherwise displayed on one of the array of visual display units 118 illustrated in Figure 7.--

IN THE ABSTRACT:

Please substitute the following Abstract for the Abstract starting at page 40, line 3 and ending at line 15. A marked-up copy of this paragraph, showing the changes made thereto is attached.

C2

--A computer games apparatus includes a server operable under the control of a computer program to generate and store data defining a 3D game environment. Objects within that environment can be moved and/or changed in response to signals received by the server from player terminals. Those signals may be transmitted via the Internet and/or other networks. The server renders the object data into data defining one or more views of the 3D environment, which data can then be processed into a broadcastable form for receipt by a plurality of observers. The performance of the apparatus is unaffected by the number of observers actually in receipt of the broadcast data.--

IN THE CLAIMS:

Please delete Claims 15, 21, 25 and 27 without prejudice or disclaimer of the subject matter recited therein.

Please amend Claims 3-6, 11-14, 16, 18, 19, 20, 22, 23, 24 and 26 as follows.

A marked-up copy of the amended claims showing the changes made thereto, is attached. Note

that all the claims currently pending in this application, including those not presently being amended, have been reproduced below for the Examiner's convenience.

1. (Not Amended) A system for playing a computer game, comprising a plurality of player apparatus for the input of user instructions and at least one game processing apparatus storing data defining a 3D game environment, wherein the player apparatus and the game processing apparatus are connected and information is transferred to enable each player to view the status of the 3D game environment and to control one or more objects therein, and wherein the system further comprises broadcast means for broadcasting data defining at least one view of the 3D game environment for receipt by a plurality of observers.

2. (Not Amended) A system according to claim 1, wherein there is a single game processing apparatus having the form of a server to which each player apparatus is connected, and wherein object control signals are sent from the player apparatus to the game processing apparatus and information defining the status of the game environment is sent from the game processing apparatus to the player apparatus.

3. (Amended) A system according to claim 1, wherein each player apparatus includes a game processing apparatus, and wherein each player apparatus sends information to the other player apparatus defining changes made to the game environment by the player at the apparatus which sends the information.

4. (Amended) A method of operating a computer graphics system to effect a computer game, which the graphics system comprises a plurality of player apparatus for

the input of user instructions and at least one game processing apparatus storing data defining a 3D game environment, the method comprising the steps of:

transferring information between the player apparatus and the game processing apparatus to enable each player to view the status of the 3D game environment and to control one or more objects therein; and

broadcasting data defining at least one view of the 3D game environment for receipt by a plurality of observers to enable the observers to view the game.

Sub D3

C4

5. (Three Times Amended) A method according to claim 4, performed in a graphics system including a single game processing apparatus, the method including sending object control signals from the player apparatus to the game processing apparatus and sending information defining the status of the game environment from the game processing apparatus to the player apparatus.

9
6. (Twice Amended) A method according to claim 7, performed in a computer graphics system in which each player apparatus includes a game processing apparatus, the method including exchanging information between the player apparatus defining changes made to the game environment in response to actions of a player at a particular player apparatus.

7. (Not Further Amended) A method according to claim 4, wherein the broadcasting step includes broadcasting on a television channel.

8. (Not Further Amended) A method according to claim 4, wherein the broadcasting step includes broadcasting on a channel defined at least in part by a communication network.

9. (Not Further Amended) A method according to claim 8, wherein the broadcasting step includes broadcasting on a channel defined at least in part by the Internet.

10. (Not Further Amended) A method according to claim 4, wherein the broadcasting step includes broadcasting in substantially real time as the computer game is played.

Sub D4

11. (Amended) A computer graphics apparatus operable to act as a game processing apparatus in a system according to claim 1, comprising:

- storage means for storing data defining a 3D game environment;
- game processing means for amending stored data in dependence upon player control of objects in the game environment and for generating and outputting data relating to the game environment for receipt by each player;
- means for generating broadcast data defining at least one view of the game environment; and
- broadcasting means operable to transmit the broadcast data on a broadcast channel.

¹⁸
~~12.~~

(Amended) Apparatus according to claim ~~11~~¹⁷, wherein the game

processing means is operable to generate and output data defining change to the game environment for receipt by each player.

¹⁹
~~13.~~

(Amended) Apparatus according to claim ~~11~~¹⁷, wherein the game

processing means is operable to generate and output data defining a plurality of views of the game environment, the plurality of views comprising a respective view of the game environment for each player.

~~20.~~

(Twice Amended) Apparatus according to claim ~~11~~¹⁷, wherein the means

for generating broadcast data is operable to generate broadcast data defining a plurality of views of the game environment for broadcast.

²¹
~~16.~~

(Amended) Apparatus according to claim ~~11~~¹⁷, wherein the broadcasting

means includes data compression means operable to convert the broadcast data into a compressed format.

17. (Not Amended) Apparatus according to claim 16, wherein the data

compression means is operable to convert data into an MPEG format.

18. (Amended) A method of operating a computer graphics apparatus in

which is stored data defining a 3D game environment, comprising:

updating the stored data in response to received signals defining player control of objects in the game;
generating data relating to the game environment and outputting the data to each respective player;
generating broadcast data defining at least one view of the game environment; and
broadcasting the broadcast data on a broadcast channel for receipt by a plurality of game observer apparatus.

²⁵
~~19~~. (Amended) A method according to claim ²⁴~~18~~, wherein data defining change to the game environment is generated and output to each respective player.

²⁶
~~20~~. (Amended) A method according to claim ²⁵~~19~~, wherein data defining a respective view of the game environment is generated and output to each respective player.

²⁷
~~22~~. (Amended) A storage medium storing instructions for causing a programmable processing apparatus to become operable to:
update data defining a 3D game environment in accordance with signals defining control of objects in the game by a plurality of players;
generate data relating to the game environment and output the data to each player;
generate broadcast data defining at least one view of the game environment

Can

broadcast the broadcast data for receipt by a plurality of game observer
apparatus.

23. (Amended) A signal carrying instructions for causing a programmable
processing apparatus to become operable to:

update data defining a 3D game environment in accordance with
signals defining control of objects in the game by a plurality of players;

generate data relating to the game environment and output the data to
each player;

generate broadcast data defining at least one view of the game
environment; and

broadcast the broadcast data for receipt by a plurality of game observer
apparatus.

30
24. (Amended) A method of generating a broadcast signal, comprising the
steps of:

receiving data defining a sequence of images of a 3D computer game
environment in which objects are controlled by a plurality of players; and

broadcasting a signal conveying images of the game for receipt by a
plurality of game observer apparatus.

Cm +

³³⁰ 30. (New) In a computer game processing system comprising at least one three-dimensional computer game processing apparatus, a plurality of player apparatus in communication with the at least one computer game processing apparatus, and a plurality of observer apparatus, a method of performing processing to enable the players to play the computer game and to enable the observers to observe the game as it is played, the method comprising the steps of:

transmitting data between the at least one game processing apparatus and the plurality of player apparatus, and between the plurality of player apparatus and the at

least one game processing apparatus, to enable the players to play the game and to view the game as it is played;

generating image data defining images of the game as it evolves during play and broadcasting the image data for receipt by the plurality of observer apparatus, thereby enabling the observer apparatus to receive the image data as a one-way, non-interactive conveyance of data; and

receiving the broadcast image data at the plurality of observer apparatus and displaying the image data to the observers.

C-11
Cmt

³⁴
~~31~~. (New) A method according to claim ³³~~30~~, further comprising increasing the number of observer apparatus which receive the broadcast image data without changing the processing burden to generate the broadcast data.

32. (New) A computer game processing system operable to process data defining a three-dimensional computer game in accordance with instructions from a plurality of game players and to generate data to enable a plurality of non-playing observers to observe the playing of the game, the system comprising:

a game processing apparatus storing data defining a three-dimensional computer graphics computer game;

a plurality of player apparatus, each player apparatus being operable to receive inputs from a respective player defining game control instructions;

at least one data communication link connecting the game processing apparatus and the plurality of player apparatus to allow the transfer of data therebetween,

wherein the game processing apparatus and the plurality of player apparatus are operable to exchange data via the at least one communication link to enable the players to play the game;

a broadcast data generator operable to generate image data defining images to enable a plurality of observers to observe the playing of the game by the players and to broadcast the image data as a one-way, non-interactive conveyance of data; and

a plurality of observer apparatus, each observer apparatus being arranged to receive and display the image data broadcast by the broadcast data generator.

C-11
CMT

33. (New) A method performed in a computer graphics processing apparatus of processing data defining a three-dimensional computer graphics game, the method comprising the steps of:

processing stored game data in accordance with instructions received from a plurality of game players to control objects in the game, and to generate and output data conveying the progress of the game for receipt by each of the respective players; and

processing the stored game data to generate a sequence of images of the progressing game from at least one view, and broadcasting the image data as a one-way, non-interactive conveyance of data for receipt by a variable number of observer apparatus.

34. (New) A computer graphics processing apparatus, comprising:
a data store for storing game data defining a three-dimensional computer graphics game;

a game engine operable to process the stored game data in dependence upon received signals defining control of objects in the game by a plurality of players, and
